After the virus invades the human body, it will be quickly recognized by the human immune system, and specific immunoglobulin antibodies will appear in human blood, and the test result will be positive.

Test results are easily discernible

- **Positive result:** Two red lines appear, namely the quality control line (C) and the detection line (T). Positive results are recommended for retesting. Both results are positive and further testing is recommended.
- **Negative result:** Only the quality control line (C) appears, and no detection line (T) appears.
- **Invalid result:** When the quality control line (C) does not appear, the test is invalid. It is recommended to use a new test card to repeat the test.
- **Remarks:** Interpretation results for 15 minutes, results for interpretation over 20 minutes are invalid

Test methodology

This kit uses immunochromatography to add the blood sample to the test card. If 2019-nCoV-antibody is present in the sample, it will bind to colloidal gold-labeled 2019-nCoV recombinant protein. The immune complex moves forward along the detection card under the action of capillaries. If the sample contains the 2019-nCoV antibody, it will bind to the 2019-nCoV recombinant protein coated on the detection area on the membrane to form a purple-red stripe. The colloidal gold-labeled biotin was captured in the streptavidin-coated quality control region, forming a purple-red stripe, showing 2019-nCoV-antibody positive.

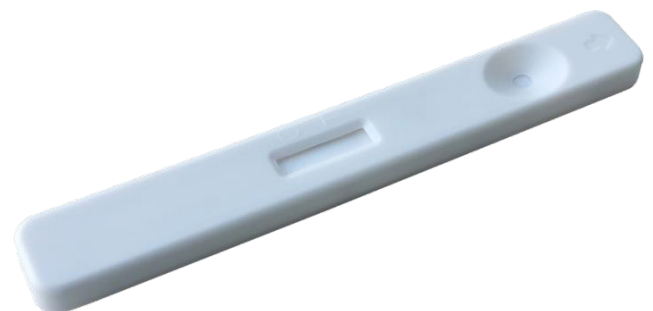

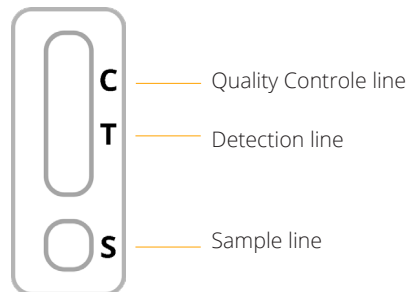

Certificates

98/79/EC
 ISO 13485:2012 - TÜV SÜD CERTIFICATION
 CE EU CERTIFICATION

Key features

1. Easy sampling of fingertip blood at home
2. Quick results in 15 minutes
3. Test results are easily discernible to the naked eye
4. Widely applicable to screening of asymptomatic people and suspected patients to avoid the risk of cluster infection in hospitals

Corona Virus Test Kit - CE-certified
